DNA Sire Verification

Lots 3, 5, 32, 34, 37, 38 - DNA sire verification is pending, advertised parentage forms part of sale if sold for stud use. Results expected in 2-4 weeks. All other registered bulls are sire verified.

Myostatin NT821

We have been using the advantages of NT821 for many years now and it is a large factor in our continued carcass competition success.

Carrier cattle offer superior carcass yield and dressing percentage. With the advent of better and more affordable DNA testing, we have tested all the silver/grey bulls in this sale so that clients can make informed decisions about using NT821.

Our recommendations for the use of NT821 are that it creates extra profitability through better carcass composition, shape and yield when used in cow herds. Unless the NT821 status of heifers is known (ie pure bos indicus or low population British breeds, or tested), we recommend using bulls that are non-carriers of NT821 for heifer matings.

The test results of lots 1-17 are shown below, the black bulls were not tested as we believe that they are all non-carriers. If you have any questions on how best to utilise NT821 please talk to Lachlan.

NT821 Carriers – Lots 8, 9, 11, 12 - NT821 Non-Carriers – Lots 1, 2, 3, 5, 6, 7, 10, 13, 14, 15, 16, 17
